NIOH Report 25/2011

http://www.nioh.ac.za/publications/publications_pathaut_reports.htm

ACKNOWLEDGEMENTS

We thank all the staff members of the NIOH Pathology Department, for their invaluable contribution to the autopsy service. We also thank Prof Tony Davies for editing the manuscript.

National Institute for Occupational Health, PO Box 4788, Johannesburg, 2000, South Africa ISSN 1812-7681

EXECUTIVE SUMMARY

During 1992, 3 263 cases came to autopsy at the NIOH. Of these, 65.7% were black men, 32.1% were white and 2.1% were coloured.

Overall disease rates (per 1000 autopsies) for 1992 are shown in Figure 1.

GLOSSARY

Asbestosis Lung fibrosis caused by asbestos fibres

Coal workers' pneumoconiosis

Lung fibrosis caused by exposure to coal dust

Emphysema Lung disease caused by the destruction of the alveolar walls

1 cm in diameter

Mesothelioma A malignant tumour of the pleural cavity of the lungs

Miner A person who has worked in a controlled mine or works

Mixed exposures The multiple dust types to which a miner may be exposed, having

worked in several mining commodities in his lifetime

Prevalence The number of cases in a defined population at a given time

Silicosis Lung fibrosis caused by inhalation of silica dust; detected by the

presence of silicotic nodules in the lung tissue

Surveillance The ongoing and systematic collection, analysis and interpretation of

data related to adverse health outcomes

SECTION 1 – BACKGROUND

The Occupational Diseases in Mines and Works Act, 1973 (Act 78 of 1973) requires that the cardiorespiratory organs of a deceased person who has worked at a controlled mine or a controlled works be examined for the presence of occupational disease, regardless of the clinical cause of death and provided that the next of kin agrees. These examinations are performed by pathologists at the National Institute for Occupational Health (NIOH). A detailed report on each case examined is sent to the Medical Bureau for Occupational Diseases (MBOD). Cases certified as having a compensable disease are then referred to the Compensation Commissioner's office, where the payment for compensation is managed.

Since 1975, the pathological findings from the autopsy examinations have been recorded on the computerised PATHAUT database. PATHAUT comprises data from autopsy examinations and clinical files which include occupational histories. The database is unique and provides an important resource for both surveillance and research. These data are the only comprehensive surveillance data on occupational lung disease in the South African mining industry.

The data presented in this report summarise the PATHAUT system surveillance results, i.e. the results of the systematic collection, collation, and analysis of the pathology findings in the cardio-respiratory organs of mine workers. Data from PATHAUT are exported into, and analysed, using SAS v9.1.

This report describes autopsy cases examined during the year 1992. This and other annual reports can be accessed at www.nioh.ac.za.

Many of the cases had "mixed" exposures in that they had been employed in more than one commodity. For simplicity, cases are categorised according to the commodity in which most years of service were recorded, i.e. the commodity in which the miners had worked for the longest period.

All disease rates reported in this document are expressed per 1000. In all calculations, the denominators used are the total numbers of autopsies in specific commodities, age groups or population groups. Some of these rates must be viewed with caution, as the denominators are very small. This applies, for example, to those commodities where few workers are employed (such as manganese mining), and to the older age groups in some instances.

SECTION 2 – DEMOGRAPHIC DATA

The number of autopsies performed for 1992 is presented in Table 2-1.

TABLE 2-1 DISTRIBUTION OF AUTOPSIES BY YEAR AND POPULATION GROUP (1975-1992)

Year of autopsy	Bla N	Black White Coloured N % N %			Unkr N	Total N			
1975	2 190	71	854	28	32	1			3 076

1989	2 138	65	1 090	33	60	2			3 288
1990	2 172	64	1 155	34	51	2			3 378
1991	2 143	65	1 080	33	66	2			3 289
1992	2 144	66	1 049	32	70	2			3 263
Total	40 600	66	20 013	33	874	1	1		61 488

It is important to note that a referral bias exists: there is a low autopsy rate for black men who have left employment at the mines, whereas the majority of white retired miners come to autopsy.

The pathologists at the NIOH perform two types of autopsy examinations. For men dying distant from Johannesburg, the cardio-respiratory organs are removed locally, preserved in formalin and sent to the NIOH. Full autopsies are undertaken on men who die close to Johannesburg.

Table 2-2 shows the distribution of autopsies by population group for 1992. Autopsies of only the cardio-respiratory organs comprised 89.2% of all examinations.

TABLE 2-2 NUMBER AND PROPORTION OF AUTOPSIES BY TYPE AND POPULATION GROUP (1992)

	Black		White		Coloured		Total	
Autopsy type	N	%	N	%	N	%	N	%

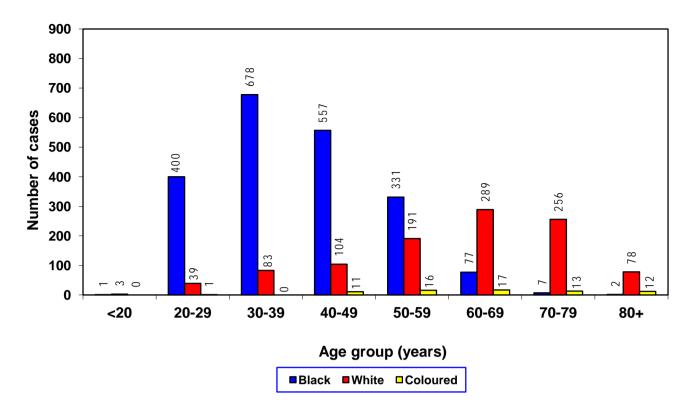

FIG 2-1 DISTRIBUTION OF AUTOPSIES BY AGE AND POPULATION GROUP (1992)

Cases were placed in categories according to the commodity in which they had worked for the longest duration (most exposure). Many men worked in a number of different mining commodities during their lifetimes and had "mixed" exposures. This was not taken into account in the analysis of exposure type (commodity).

Table 2-4 and Figure 2-2 show the distribution of autopsies by commodity and population group for 1992.

TABLE 2-4 NUMBER AND PROPORTION OF AUTOPSIES BY COMMODITY AND POPULATION GROUP (1992)

SECTION 3 – ACTIVE TUBERCULOSIS

The distribution of active tuberculosis (TB) by anatomical site is presented in Figure 3-1 (n=226). Active pulmonary TB (PTB) was diagnosed in 5.2% (n=169) of all cases autopsied in 1992. Most of the men with PTB were black (89.3%; 151 cases), 7.1% (12 cases) were white and 3.6% (6 cases) were coloured.

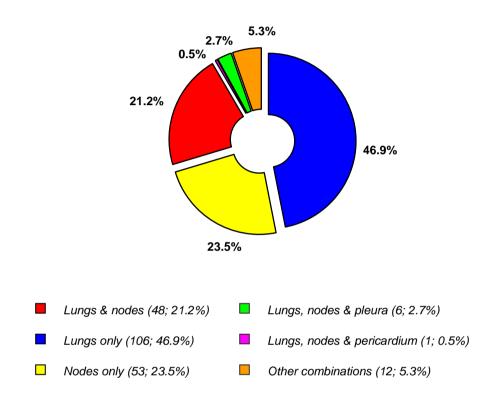

FIG 3-1 DISTRIBUTION OF ACTIVE TB BY SITE (1992)

The distribution of active PTB cases by commodity is shown in Table 3-1. The rates in this and subsequent tables and figures are expressed per 1000. The majority of active PTB cases (86.4%) came from the gold mining industry (74.7% of all autopsy cases came from that commodity).

TABLE 3-1 NUMBER OF CASES AND PREVALENCE OF ACTIVE PTB BY COMMODITY AND POPULATION GROUP (1992)

Commodity	Bla	nck	Wh	White		ured	Total	
Commodity	N	Rate	N	Rate	N	Rate	N	Rate

Unknown	6	66	0	-	0	-	6	62
Total	151	70	12	11	6	86	169	52

SECTION 4 – SILICOSIS

Silicotic nodules were found in the lungs of 393 cases (12.0% of all autopsies), 95.7% of which came from the gold mining industry. Of all cases of silicosis, occasional silicotic nodules were found in 45.3% of cases, a few in 24.2%, a moderate number in 20.1%, a large number in 7.4% and in 3.1% of the cases severity was not stated.

The distribution of cases with silicosis by commodity and population group is presented in Table 4-1.

TABLE 4-1 NUMBER OF CASES AND PREVALENCE OF SILICOSIS BY COMMODITY AND POPULATION GROUP (1992)

Commodity	Black		Wh	White		ured	Total

SECTION 5 – OTHER PNEUMOCONIOSES

MASSIVE FIBROSIS

There were 21(0.6%) cases of massive fibrosis (15 black and 6 white). Seventeen cases of massive fibrosis were from gold, two from platinum and for two cases the commodity was not known.

COAL WORKERS' PNEUMOCONIOSIS

There were 21 (0.6%) cases of coal workers' pneumoconiosis of which 15 cases were from the coal, four from gold, and one each from the platinum and asbestos mining industries. For one case the commodity was not known.

MIXED DUST PNEUMOCONIOSIS

There were 11 (0.3%) cases of mixed dust pneumoconiosis. These cases came from the gold (n=10) and coal (n=1) mining industries.

ASBESTOSIS AND PLEURAL PLAQUES

There were 100 cases of asbestosis of which 63.0% (n=63) had slight, 35% (n=35) moderate and 2% (n=2) marked fibrosis. Of these, 73 (73.0%) had worked in the asbestos mining industry at some time in their lives. There were 27 cases that had asbestos plaques and 16 (59.3%) of these had asbestosis. Note that the parietal pleura (the site where plaque formation usually occurs) is seldom submitted with the lungs.

The distribution of asbestosis by age and population group is shown in Table 5-1.

SECTION 6 – EMPHYSEMA

There were 664 cases of emphysema, the extent of which was mild in 68.2% (n=453), moderate in 27.0% (n=179) and marked in 4.8% (n=32). The distribution of emphysema by age and population group is presented in Table 6-1.

SECTION 8 – PRIMARY LUNG CANCER

Ninety nine cases of primary lung cancer were found at autopsy, 25.3% of which were in black, 63.6% in white and 11.1% in coloured men. Most of the cases were squamous lung carcinomas (41.4%; n=41), followed by large cell lung carcinoma (21.2%; n=21) and small cell lung carcinomas (21.2%; n=21), adeno carcinoma (12.1%; n=12) and broncho-alveolar carcinoma (4.0%; n=4).

The distribution of primary lung cancer by age and population group is presented in Table 8-1.

SECTION 9 – CLINICAL CAUSES OF DEATH

Table 9-1 and Figure 9-1 show the clinical causes of death as stated in the accompanying documents submitted with the cardio-respiratory organs, by population group. Diseases of the cardio-vascular system were the most frequent (10.0%) overall. Black men had the highest proportion of unnatural causes of death (46.9%). In 25.3% of all cases, the cause of death was not stated.
